

Chapter 07.08

Simpson 3/8 Rule for Integration

After reading this chapter, you should be able to

- 1. derive the formula for Simpson's 3/8 rule of integration,*
- 2. use Simpson's 3/8 rule to solve integrals,*
- 3. develop the formula for multiple-segment Simpson's 3/8 rule of integration,*
- 4. use multiple-segment Simpson's 3/8 rule of integration to solve integrals,*
- 5. compare true error formulas for multiple-segment Simpson's 1/3 rule and multiple-segment Simpson's 3/8 rule, and*
- 6. use a combination of Simpson's 1/3 rule and Simpson's 3/8 rule to approximate integrals.*

Introduction

The main objective of this chapter is to develop appropriate formulas for approximating the integral of the form

$$I = \int_a^b f(x) dx \quad (1)$$

Most (if not all) of the developed formulas for integration are based on a simple concept of approximating a given function $f(x)$ by a simpler function (usually a polynomial function) $f_i(x)$, where i represents the order of the polynomial function. In Chapter 07.03, Simpson's 1/3 rule for integration was derived by approximating the integrand $f(x)$ with a 2nd order (quadratic) polynomial function. $f_2(x)$

$$f_2(x) = a_0 + a_1x + a_2x^2 \quad (2)$$

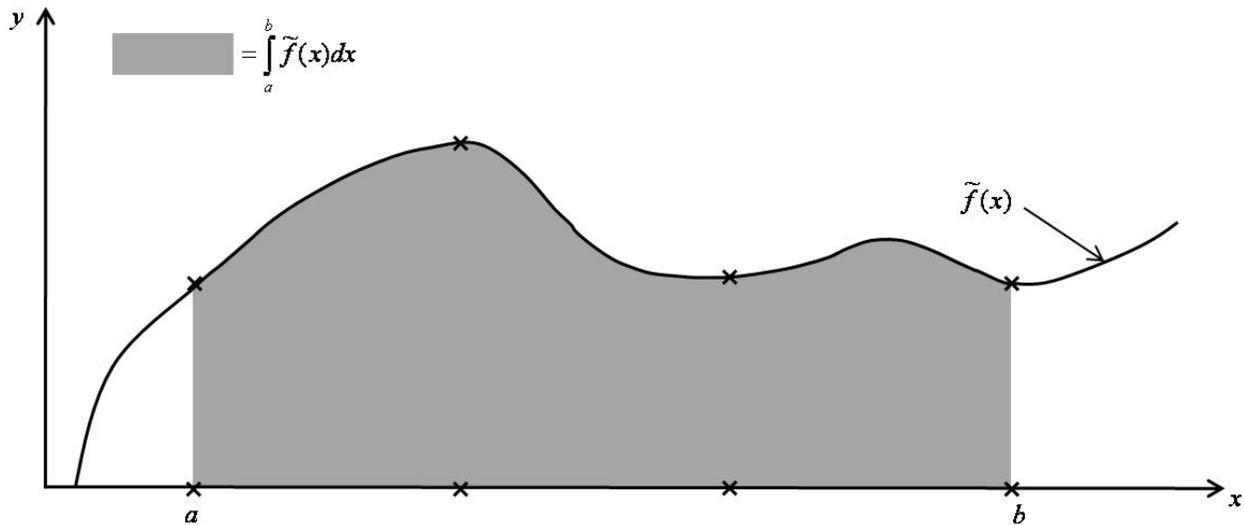

Figure 1 $\tilde{f}(x)$ Cubic function.

In a similar fashion, Simpson 3/8 rule for integration can be derived by approximating the given function $f(x)$ with the 3rd order (cubic) polynomial $f_3(x)$

$$\begin{aligned}
 f_3(x) &= a_0 + a_1x + a_2x^2 + a_3x^3 \\
 &= \{1, x, x^2, x^3\} \times \begin{bmatrix} a_0 \\ a_1 \\ a_2 \\ a_3 \end{bmatrix}
 \end{aligned} \quad (3)$$

which can also be symbolically represented in Figure 1.

Method 1

The unknown coefficients a_0, a_1, a_2 and a_3 in Equation (3) can be obtained by substituting 4 known coordinate data points $\{x_0, f(x_0)\}, \{x_1, f(x_1)\}, \{x_2, f(x_2)\}$ and $\{x_3, f(x_3)\}$ into Equation (3) as follows.

$$\begin{aligned}
 f(x_0) &= a_0 + a_1x_0 + a_2x_0^2 + a_3x_0^3 \\
 f(x_1) &= a_0 + a_1x_1 + a_2x_1^2 + a_3x_1^3 \\
 f(x_2) &= a_0 + a_1x_2 + a_2x_2^2 + a_3x_2^3 \\
 f(x_3) &= a_0 + a_1x_3 + a_2x_3^2 + a_3x_3^3
 \end{aligned} \quad (4)$$

Equation (4) can be expressed in matrix notation as

$$\begin{bmatrix} 1 & x_0 & x_0^2 & x_0^3 \\ 1 & x_1 & x_1^2 & x_1^3 \\ 1 & x_2 & x_2^2 & x_2^3 \\ 1 & x_3 & x_3^2 & x_3^3 \end{bmatrix} \begin{bmatrix} a_0 \\ a_1 \\ a_2 \\ a_3 \end{bmatrix} = \begin{bmatrix} f(x_0) \\ f(x_1) \\ f(x_2) \\ f(x_3) \end{bmatrix} \quad (5)$$

The above Equation (5) can symbolically be represented as

$$[A]_{4 \times 4} \vec{a}_{4 \times 1} = \vec{f}_{4 \times 1} \quad (6)$$

Thus,

$$\vec{a} = \begin{bmatrix} a_1 \\ a_2 \\ a_3 \\ a_4 \end{bmatrix} = [A]^{-1} \times \vec{f} \quad (7)$$

Substituting Equation (7) into Equation (3), one gets

$$f_3(x) = \{1, x, x^2, x^3\} \times [A]^{-1} \times \vec{f} \quad (8)$$

As indicated in Figure 1, one has

$$\left. \begin{aligned} x_0 &= a \\ x_1 &= a + h \\ &= a + \frac{b-a}{3} \\ &= \frac{2a+b}{3} \\ x_2 &= a + 2h \\ &= a + \frac{2b-2a}{3} \\ &= \frac{a+2b}{3} \\ x_3 &= a + 3h \\ &= a + \frac{3b-3a}{3} \\ &= b \end{aligned} \right\} \quad (9)$$

With the help from MATLAB [Ref. 2], the unknown vector \vec{a} (shown in Equation 7) can be solved for symbolically.

Method 2

Using Lagrange interpolation, the cubic polynomial function $f_3(x)$ that passes through 4 data points (see Figure 1) can be explicitly given as

$$\begin{aligned}
 f_3(x) = & \frac{(x-x_1)(x-x_2)(x-x_3)}{(x_0-x_1)(x_0-x_2)(x_0-x_3)} \times f(x_0) + \frac{(x-x_0)(x-x_2)(x-x_3)}{(x_1-x_0)(x_1-x_2)(x_1-x_3)} \times f(x_1) \\
 & + \frac{(x-x_0)(x-x_1)(x-x_3)}{(x_2-x_0)(x_2-x_1)(x_2-x_3)} \times f(x_3) + \frac{(x-x_0)(x-x_1)(x-x_2)}{(x_3-x_0)(x_3-x_1)(x_3-x_2)} \times f(x_3)
 \end{aligned} \tag{10}$$

Simpsons 3/8 Rule for Integration

Substituting the form of $f_3(x)$ from Method (1) or Method (2),

$$\begin{aligned}
 I &= \int_a^b f(x) dx \\
 &\approx \int_a^b f_3(x) dx \\
 &= (b-a) \times \frac{\{f(x_0) + 3f(x_1) + 3f(x_2) + f(x_3)\}}{8}
 \end{aligned} \tag{11}$$

Since

$$h = \frac{b-a}{3}$$

$$b-a = 3h$$

and Equation (11) becomes

$$I \approx \frac{3h}{8} \times \{f(x_0) + 3f(x_1) + 3f(x_2) + f(x_3)\} \tag{12}$$

Note the 3/8 in the formula, and hence the name of method as the Simpson's 3/8 rule.

The true error in Simpson 3/8 rule can be derived as [Ref. 1]

$$E_t = -\frac{(b-a)^5}{6480} \times f''''(\zeta), \text{ where } a \leq \zeta \leq b \tag{13}$$

Example 1

The vertical distance in meters covered by a rocket from $t = 8$ to $t = 30$ seconds is given by

$$s = \int_8^{30} \left(2000 \ln \left[\frac{140000}{140000 - 2100t} \right] - 9.8t \right) dt$$

Use Simpson 3/8 rule to find the approximate value of the integral.

Solution

$$\begin{aligned}
 h &= \frac{b-a}{n} \\
 &= \frac{b-a}{3} \\
 &= \frac{30-8}{3} \\
 &= 7.3333
 \end{aligned}$$

$$f(t) = 2000 \ln \left[\frac{140000}{140000 - 2100t} \right] - 9.8t$$

$$I \approx \frac{3h}{8} \times \{f(t_0) + 3f(t_1) + 3f(t_2) + f(t_3)\}$$

$$t_0 = 8$$

$$\begin{aligned}
 f(t_0) &= 2000 \ln \left(\frac{140000}{140000 - 2100 \times 8} \right) - 9.8 \times 8 \\
 &= 177.2667
 \end{aligned}$$

$$\left\{ \begin{aligned}
 t_1 &= t_0 + h \\
 &= 8 + 7.3333 \\
 &= 15.3333 \\
 f(t_1) &= 2000 \ln \left(\frac{140000}{140000 - 2100 \times 15.3333} \right) - 9.8 \times 15.3333 \\
 &= 372.4629
 \end{aligned} \right.$$

$$\left\{ \begin{aligned}
 t_2 &= t_0 + 2h \\
 &= 8 + 2(7.3333) \\
 &= 22.6666 \\
 f(t_2) &= 2000 \ln \left(\frac{140000}{140000 - 2100 \times 22.6666} \right) - 9.8 \times 22.6666 \\
 &= 608.8976
 \end{aligned} \right.$$

$$\left\{ \begin{array}{l} t_3 = t_0 + 3h \\ \quad = 8 + 3(7.3333) \\ \quad = 30 \\ f(t_3) = 2000 \ln \left(\frac{140000}{140000 - 2100 \times 30} \right) - 9.8 \times 30 \\ \quad = 901.6740 \end{array} \right.$$

Applying Equation (12), one has

$$\begin{aligned} I &= \frac{3}{8} \times 7.3333 \times \{177.2667 + 3 \times 372.4629 + 3 \times 608.8976 + 901.6740\} \\ &= 11063.3104 m \end{aligned}$$

The exact answer can be computed as

$$I_{exact} = 11061.34 m$$

Multiple Segments for Simpson 3/8 Rule

Using n = number of equal segments, the width h can be defined as

$$h = \frac{b - a}{n} \quad (14)$$

The number of segments need to be an integer multiple of 3 as a single application of Simpson 3/8 rule requires 3 segments.

The integral shown in Equation (1) can be expressed as

$$\begin{aligned} I &= \int_a^b f(x) dx \\ &\approx \int_a^b f_3(x) dx \\ &\approx \int_{x_0=a}^{x_3} f_3(x) dx + \int_{x_3}^{x_6} f_3(x) dx + \dots + \int_{x_{n-3}}^{x_n=b} f_3(x) dx \end{aligned} \quad (15)$$

Using Simpson 3/8 rule (See Equation 12) into Equation (15), one gets

$$I = \frac{3h}{8} \left\{ f(x_0) + 3f(x_1) + 3f(x_2) + f(x_3) + f(x_3) + 3f(x_4) + 3f(x_5) + f(x_6) \right\} \quad (16)$$

$$= \frac{3h}{8} \left\{ f(x_0) + 3 \sum_{i=1,4,7,\dots}^{n-2} f(x_i) + 3 \sum_{i=2,5,8,\dots}^{n-1} f(x_i) + 2 \sum_{i=3,6,9,\dots}^{n-3} f(x_i) + f(x_n) \right\} \quad (17)$$

Example 2

The vertical distance in meters covered by a rocket from $t = 8$ to $t = 30$ seconds is given by

$$s = \int_8^{30} \left(2000 \ln \left[\frac{140000}{140000 - 2100t} \right] - 9.8t \right) dt$$

Use Simpson 3/8 multiple segments rule with six segments to estimate the vertical distance.

Solution

In this example, one has (see Equation 14):

$$f(t) = 2000 \ln \left[\frac{140000}{140000 - 2100t} \right] - 9.8t$$

$$h = \frac{30 - 8}{6} = 3.6666$$

$$\{t_0, f(t_0)\} = \{8, 177.2667\}$$

$$\{t_1, f(t_1)\} = \{11.6666, 270.4104\} \text{ where } t_1 = t_0 + h = 8 + 3.6666 = 11.6666$$

$$\{t_2, f(t_2)\} = \{15.3333, 372.4629\} \text{ where } t_2 = t_0 + 2h = 15.3333$$

$$\{t_3, f(t_3)\} = \{19, 484.7455\} \text{ where } t_3 = t_0 + 3h = 19$$

$$\{t_4, f(t_4)\} = \{22.6666, 608.8976\} \text{ where } t_4 = t_0 + 4h = 22.6666$$

$$\{t_5, f(t_5)\} = \{26.3333, 746.9870\} \text{ where } t_5 = t_0 + 5h = 26.3333$$

$$\{t_6, f(t_6)\} = \{30, 901.6740\} \text{ where } t_6 = t_0 + 6h = 30$$

Applying Equation (17), one obtains:

$$\begin{aligned} I &= \frac{3}{8} (3.6666) \left\{ 177.2667 + 3 \sum_{i=1,4,\dots}^{n-2=4} f(t_i) + 3 \sum_{i=2,5,\dots}^{n-1=5} f(t_i) + 2 \sum_{i=3,6,\dots}^{n-3=3} f(t_i) + 901.6740 \right\} \\ &= (1.3750) \left\{ 177.2667 + 3(270.4104 + 608.8976) \right. \\ &\quad \left. + 3(372.4629 + 746.9870) + 2(484.7455) + 901.6740 \right\} \\ &= 11,601.4696 \text{ m} \end{aligned}$$

Example 3

Compute

$$I = \int_8^{30} \left\{ 2000 \ln \left(\frac{140000}{140000 - 2100t} \right) - 9.8t \right\} dt,$$

using Simpson 1/3 rule (with $n_1 = 4$), and Simpson 3/8 rule (with $n_2 = 3$).

Solution

The segment width is

$$\begin{aligned} h &= \frac{b - a}{n} \\ &= \frac{b - a}{n_1 + n_2} \end{aligned}$$

$$\begin{aligned}
 &= \frac{30 - 8}{(4 + 3)} \\
 &= 3.1429
 \end{aligned}$$

$$f(t) = 2000 \ln \left[\frac{140000}{140000 - 2100t} \right] - 9.8t$$

$$\left. \begin{aligned}
 t_0 &= a = 8 \\
 t_1 &= x_0 + 1h = 8 + 3.1429 = 11.1429 \\
 t_2 &= t_0 + 2h = 8 + 2(3.1429) = 14.2857 \\
 t_3 &= t_0 + 3h = 8 + 3(3.1429) = 17.4286 \\
 t_4 &= t_0 + 4h = 8 + 4(3.1429) = 20.5714 \\
 t_5 &= t_0 + 5h = 8 + 5(3.1429) = 23.7143 \\
 t_6 &= t_0 + 6h = 8 + 6(3.1429) = 26.8571 \\
 t_7 &= t_0 + 7h = 8 + 7(3.1429) = 30
 \end{aligned} \right\} \text{Simpson's 1/3 rule}$$

Now

$$\begin{aligned}
 f(t_0 = 8) &= 2000 \ln \left(\frac{140,000}{140,000 - 2100 \times 8} \right) - 9.8 \times 8 \\
 &= 177.2667
 \end{aligned}$$

Similarly:

$$\begin{aligned}
 f(t_1) &= 256.5863 \\
 f(t_2) &= 342.3241 \\
 f(t_3) &= 435.2749 \\
 f(t_4) &= 536.3909 \\
 f(t_5) &= 646.8260 \\
 f(t_6) &= 767.9978 \\
 f(t_7) &= 901.6740
 \end{aligned}$$

For multiple segments ($n_1 =$ first 4 segments), using Simpson 1/3 rule, one obtains (See Equation 19):

$$\begin{aligned}
 I_1 &= \left(\frac{h}{3} \right) \left\{ f(t_0) + 4 \sum_{i=1,3,\dots}^{n_1-1=3} f(t_i) + 2 \sum_{i=2,\dots}^{n_1-2=2} f(t_i) + f(t_{n_1}) \right\} \\
 &= \left(\frac{h}{3} \right) \{ f(t_0) + 4(f(t_1) + f(t_3)) + 2f(t_2) + f(t_4) \} \\
 &= \left(\frac{3.1429}{3} \right) \{ 177.2667 + 4(256.5863 + 435.2749) + 2(342.3241) + 536.3909 \} \\
 &= 4364.1197
 \end{aligned}$$

For multiple segments ($n_2 =$ last 3 segments), using Simpson 3/8 rule, one obtains (See Equation 17):

$$\begin{aligned}
 I_2 &= \left(\frac{3h}{8}\right) \left\{ f(t_0) + 3 \sum_{i=1,3,\dots}^{n_2-2=1} f(t_i) + 3 \sum_{i=2,\dots}^{n_2-1=2} f(t_i) + 2 \sum_{i=3,6,\dots}^{n_2-3=0} f(t_i) + f(t_{n_1}) \right\} \\
 &= \left(\frac{3h}{8}\right) \{ f(t_0) + 3f(t_1) + 3f(t_2) + 2(\text{no contribution}) + f(t_3) \} \\
 &= \left(\frac{3h}{8}\right) \{ f(t_4) + 3f(t_5) + 3f(t_6) + f(t_7) \} \\
 &= \left(\frac{3}{8} \times 3.1429\right) \{ 536.3909 + 3(646.8260) + 3(767.9978) + 901.6740 \} \\
 &= 6697.3663
 \end{aligned}$$

The mixed (combined) Simpson 1/3 and 3/8 rules give

$$\begin{aligned}
 I &= I_1 + I_2 \\
 &= 4364.1197 + 6697.3663 \\
 &= 11061m
 \end{aligned}$$

Comparing the truncated error of Simpson 1/3 rule

$$E_t = -\frac{(b-a)^5}{2880} \times f''''(\zeta) \quad (18)$$

With Simpson 3/8 rule (See Equation 12), it seems to offer slightly more accurate answer than the former. However, the cost associated with Simpson 3/8 rule (using 3rd order polynomial function) is significantly higher than the one associated with Simpson 1/3 rule (using 2nd order polynomial function).

The number of multiple segments that can be used in the conjunction with Simpson 1/3 rule is 2, 4, 6, 8, ... (any even numbers) for

$$\begin{aligned}
 I &= \int_a^b f(x) dx \\
 &\approx \left(\frac{h}{3}\right) \{ f(x_0) + 4f(x_1) + f(x_2) + f(x_2) + 4f(x_3) + f(x_4) + \dots + f(x_{n-2}) + 4f(x_{n-1}) + f(x_n) \} \\
 &= \left(\frac{h}{3}\right) \left\{ f(x_0) + 4 \sum_{i=1,3,\dots}^{n-1} f(x_i) + 2 \sum_{i=2,4,6,\dots}^{n-2} f(x_i) + f(x_n) \right\} \quad (19)
 \end{aligned}$$

However, Simpson 3/8 rule can be used with the number of segments equal to 3,6,9,12,.. (can be certain integers that are multiples of 3).

If the user wishes to use, say 7 segments, then the mixed Simpson 1/3 rule (for the first 4 segments), and Simpson 3/8 rule (for the last 3 segments) would be appropriate.

Computer Algorithm for Mixed Simpson 1/3 and 3/8 Rule for Integration

Based on the earlier discussion on (single and multiple segments) Simpson 1/3 and 3/8 rules, the following “pseudo” step-by-step mixed Simpson rules for estimating

$$I = \int_a^b f(x)dx$$

can be given as

Step 1

User inputs information, such as

$$f(x) = \text{integrand}$$

n_1 = number of segments in conjunction with Simpson 1/3 rule (a multiple of 2 (any even numbers))

n_2 = number of segments in conjunction with Simpson 3/8 rule (a multiple of 3)

Step 2

Compute

$$n = n_1 + n_2$$

$$h = \frac{b-a}{n}$$

$$x_0 = a$$

$$x_1 = a + 1h$$

$$x_2 = a + 2h$$

.

.

$$x_i = a + ih$$

.

.

$$x_n = a + nh = b$$

Step 3

Compute result from multiple-segment Simpson 1/3 rule (See Equation 19)

$$I_1 = \left(\frac{h}{3}\right) \left\{ f(x_0) + 4 \sum_{i=1,3,\dots}^{n_1-1} f(x_i) + 2 \sum_{i=2,4,6,\dots}^{n_1-2} f(x_i) + f(x_{n_1}) \right\} \quad (19, \text{repeated})$$

Step 4

Compute result from multiple segment Simpson 3/8 rule (See Equation 17)

$$I_2 = \left(\frac{3h}{8}\right) \left\{ f(x_0) + 3 \sum_{i=1,4,7,\dots}^{n_2-2} f(x_i) + 3 \sum_{i=2,5,8,\dots}^{n_2-1} f(x_i) + 2 \sum_{i=3,6,9,\dots}^{n_2-3} f(x_i) + f(x_{n_2}) \right\} \quad (17, \text{repeated})$$

Step 5

$$I \approx I_1 + I_2 \quad (20)$$

and print out the final approximated answer for I .
