# Effect of Significant Digits on Derivative of a Function 

Ana Catalina Torres, Autar Kaw University of South Florida United States of America kaw@eng.usf.edu

## Introduction

This worksheet demonstrates the use of Mathcad to illustrate the effect of significant digit: numerical calculation of the Forward Difference Approximation of the first derivative of continuous functions.

Forward Difference Approximation of the first derivative uses a point $h$ ahead of the given of $x$ at which the derivative of $f(x)$ is to be found.

$$
f^{\prime}(x) \approx \frac{f(x+h)-f(x)}{h}
$$

## Section 1: Input

The following simulation approximates the first derivative of a function using Forward Di Approximation. The user inputs are
a) function, $f(x)$
b) point at which the derivative is to be found, $x v$
c) step size, $h$
d) lowest and highest number of significant digits user wants to use in the calcluation. The user should choose the lowest number to be at least 2 .

The outputs include
a) exact value
c) true error and absolute relative true error as a function of significant digits.

Function $f(x)$

$$
\mathrm{f}(\mathrm{x}):=\mathrm{x} \cdot \exp (2 \cdot \mathrm{x})
$$

Value of $x$ at which $f^{\prime}(x)$ is desired, $x v$

$$
\text { xv := } 4.0
$$

Starting step size, $h$

$$
\mathrm{h}:=0.5
$$

Lowest number of Significant Digits and Highest Number of Significant Digits

$$
\text { nlow }:=2 \quad \text { nhigh }:=10
$$

This is the end of the user section. All the information must be entered before proceeding $t$ next section.

## Section 2: Significant Digit Operators

The following functions modify standard arithmetic operators allowing computation with 1 appropriate number of significant digits. These redefined operators are then used in the Forward Difference Approximation method to generate a solution that was computed with number of significant digits specified.

$$
\text { sdscale }(\mathrm{sd}, \mathrm{k}):=\left\lvert\, \begin{aligned}
& \mathrm{m} \leftarrow \mathrm{sd} \text { if } \mathrm{k}=0 \\
& \mathrm{~m} \leftarrow \mathrm{sd}-\operatorname{floor}(\log (|\mathrm{k}|)+1) \text { otherwise } \\
& \mathrm{q} \leftarrow \mathrm{k} \cdot 10^{\mathrm{m}} \\
& \mathrm{q} \leftarrow \operatorname{floor}(\mathrm{q}) \cdot 10^{-\mathrm{m}} \\
& \mathrm{q}
\end{aligned}\right.
$$

$\operatorname{add}(\mathrm{a}, \mathrm{b}):=\left\lvert\, \begin{aligned} & \mathrm{c} \leftarrow \mathrm{a}+\mathrm{b} \\ & \mathrm{c}\end{aligned}\right.$
$\operatorname{sub}(\mathrm{a}, \mathrm{b}):=\left\lvert\, \begin{aligned} & \mathrm{c} \leftarrow \mathrm{a}-\mathrm{b} \\ & \mathrm{c}\end{aligned}\right.$
$\operatorname{mul}(\mathrm{a}, \mathrm{b}):=\left\lvert\, \begin{aligned} & \mathrm{c} \leftarrow \mathrm{a} \cdot \mathrm{b} \\ & \mathrm{c}\end{aligned}\right.$
$\operatorname{div}(\mathrm{a}, \mathrm{b}):=\left\lvert\, \begin{aligned} & \mathrm{c} \leftarrow \frac{\mathrm{a}}{\mathrm{b}} \\ & \mathrm{c}\end{aligned}\right.$
$\operatorname{sdadd}(\operatorname{sd}, \mathrm{a}, \mathrm{b}):=\left\lvert\, \begin{aligned} & \mathrm{d} \leftarrow \operatorname{sdscale}(\operatorname{sd}, \operatorname{add}(\operatorname{sdscale}(\operatorname{sd}, \mathrm{a}), \operatorname{sdscale}(\operatorname{sd}, \mathrm{b})))) \\ & \mathrm{d}\end{aligned}\right.$
$\operatorname{sdsub}(\operatorname{sd}, \mathrm{a}, \mathrm{b}):=\left\lvert\, \begin{aligned} & \mathrm{d} \leftarrow \operatorname{sdscale}(\operatorname{sd}, \operatorname{sub}(\operatorname{sdscale}(\operatorname{sd}, \mathrm{a}), \operatorname{sdscale}(\operatorname{sd}, \mathrm{b})))) \\ & \mathrm{d}\end{aligned}\right.$
$\operatorname{sdmul}(\operatorname{sd}, \mathrm{a}, \mathrm{b}):=\left\lvert\, \begin{aligned} & \mathrm{d} \leftarrow \operatorname{sdscale}(\operatorname{sd}, \operatorname{mul}(\operatorname{sdscale}(\mathrm{sd}, \mathrm{a}), \operatorname{sdscale}(\mathrm{sd}, \mathrm{b}))))\end{aligned}\right.$
$\operatorname{sddiv}(\operatorname{sd}, \mathrm{a}, \mathrm{b}):=\left\lvert\, \begin{aligned} & \mathrm{d} \leftarrow \operatorname{sdscale}(\operatorname{sd}, \operatorname{div}(\operatorname{sdscale}(\operatorname{sd}, \mathrm{a}), \operatorname{sdscale}(\mathrm{sd}, \mathrm{b}))) \\ & \mathrm{d}\end{aligned}\right.$

## Section 3: Calculation

The following procedure estimates the solution of first derivate of an equation at a point $x \nu$.

$$
\begin{aligned}
& f(x)=\text { function } \\
& x v=\text { value at which the solution is desired } \\
& h=\text { starting step size value } \\
& s d=\text { number of significant digits used in the calculation } \\
& \operatorname{FDD}(\mathrm{f}, \mathrm{xv}, \mathrm{~h}, \mathrm{sd}):=\left\lvert\, \begin{array}{l}
\text { deriv } \leftarrow \operatorname{sddiv}(\operatorname{sd}, \operatorname{sdsub}(\mathrm{sd}, \mathrm{f}(\operatorname{sdadd}(\mathrm{sd}, \mathrm{xv}, \mathrm{~h})), \mathrm{f}(\mathrm{xv})), \mathrm{h}) \\
\text { deriv }
\end{array}\right.
\end{aligned}
$$

## Section 4: Calculation

The exact value EV of the first derivative of the equation:
Given the function

$$
\mathrm{f}(\mathrm{x}) \rightarrow \mathrm{x} \cdot \mathrm{e}^{2 \cdot \mathrm{x}}
$$

First, using the derivative command the solution is found. In the second step, the exact value of the derivative is shown
The solution of the first derivative is

$$
f^{\prime}(x):=\left(\frac{d}{d x} f(x)\right) \quad f(x) \rightarrow e^{2 \cdot x}+2 \cdot x \cdot e^{2 \cdot x}
$$

The exact solution of the first derivative is

$$
\begin{aligned}
& \mathrm{EV}:=\mathrm{f}^{\prime}(\mathrm{xv}) \\
& \mathrm{EV}=26828.621883
\end{aligned}
$$

The next loop calculate the following:
Av: Approximate value of the first derivative using Forward Difference
Approximation by calling the procedure "FDD"
Et: True error
$\varepsilon_{\mathrm{t}}$ : Absolute relative true percentage error
Ea: Approximate error
$\varepsilon_{\mathrm{a}}$ : Absolute relative approximate percentage error

$$
\begin{aligned}
& \text { table1 }:=\text { for } \mathrm{i} \in \text { nlow } . . \text { nhigh } \\
& \qquad \begin{array}{l}
\text { Digits }_{\mathrm{i}} \leftarrow \mathrm{i} \\
\mathrm{AV}_{\mathrm{i}} \leftarrow \operatorname{FDD}(\mathrm{f}, \mathrm{xv}, \mathrm{~h}, \mathrm{i}) \\
\mathrm{E}_{\mathrm{t}_{\mathrm{i}}} \leftarrow \mathrm{EV}-\mathrm{AV}_{\mathrm{i}} \\
\varepsilon_{\mathrm{t}_{\mathrm{i}}} \leftarrow\left|\begin{array}{l}
\mathrm{E}_{\mathrm{t}_{\mathrm{i}}} \\
\mathrm{EV} \\
\text { augment } \\
\text { augits, } 100
\end{array}\right|
\end{array}
\end{aligned}
$$

The loop calculates the approximate value of the first derivative, the corresponding true error and relative true error as a function of the number of significant digits used in the calculations.

## Section 5: Table of Values

The next table shows the approximate value, true error, and the absolute relative true percentage error as a function of the number of significant digits used in the calculations.

| Digits |  |  | AV |  |  |  |
| :---: | ---: | ---: | ---: | ---: | :---: | :---: |
|  | 0 | 1 | 2 | $E_{t}$ |  |  |
| 0 | $0 \cdot 10^{0}$ | $0 \cdot 10^{0}$ | $0 \cdot 10^{0}$ | $0 \cdot 10^{0}$ |  |  |
| 1 | $0 \cdot 10^{0}$ | $0 \cdot 10^{0}$ | $0 \cdot 10^{0}$ | $0 \cdot 10^{0}$ |  |  |
| 2 | $2 \cdot 10^{0}$ | $5 \cdot 10^{4}$ | $-2.317 \cdot 10^{4}$ | $8.637 \cdot 10^{1}$ |  |  |
| 3 | $3 \cdot 10^{0}$ | $4.9 \cdot 10^{4}$ | $-2.217 \cdot 10^{4}$ | $8.264 \cdot 10^{1}$ |  |  |
| 4 | $4 \cdot 10^{0}$ | $4.908 \cdot 10^{4}$ | $-2.225 \cdot 10^{4}$ | $8.294 \cdot 10^{1}$ |  |  |
| 4 | $5 \cdot 10^{0}$ | $4.908 \cdot 10^{4}$ | $-2.225 \cdot 10^{4}$ | $8.294 \cdot 10^{1}$ |  |  |
| 5 | $6 \cdot 10^{0}$ | $4.908 \cdot 10^{4}$ | $-2.225 \cdot 10^{4}$ | $8.294 \cdot 10^{1}$ |  |  |
| 6 | $7 \cdot 10^{0}$ | $4.908 \cdot 10^{4}$ | $-2.225 \cdot 10^{4}$ | $8.294 \cdot 10^{1}$ |  |  |
| 7 | $8 \cdot 10^{0}$ | $4.908 \cdot 10^{4}$ | $-2.225 \cdot 10^{4}$ | $8.294 \cdot 10^{1}$ |  |  |
| 8 | $9 \cdot 10^{0}$ | $4.908 \cdot 10^{4}$ | $-2.225 \cdot 10^{4}$ | $8.294 \cdot 10^{1}$ |  |  |
| 9 | $1 \cdot 10^{1}$ | $4.908 \cdot 10^{4}$ | $-2.225 \cdot 10^{4}$ | $8.294 \cdot 10^{1}$ |  |  |
| 10 |  |  |  |  |  |  |

## Section 5: Graphs

The following graphs show the approximate solution, true error and absolute relative true error as a function of the number of significant digits used.
$\mathrm{a}:=\mathrm{FDD}(\mathrm{f}, \mathrm{xv}, \mathrm{h}$, nlow)
$\mathrm{b}:=\operatorname{FDD}(\mathrm{f}, \mathrm{xv}, \mathrm{h}$, nlow +1$)$
Override the default axis limits on the graphs to visualize the desired range:
Click in the plot to select it. Click on the number closest to the axis limit you wish to change and type a new number or expression. Click outside the plot region to redisplay the plot using the new numbers specified as axis limits.

## Questions

1. The velocity of a rocket is given by

$$
v(t)=2000 \cdot \ln \frac{140000}{140000-2100 \cdot t}-9.8 \cdot t
$$

Use Forward Divided Difference method with a step size of 0.25 to find the acceleration at $t=5 s$ using different number of significant digits.

## Conclusions

The effect of significant digits on the calculation of the first derivative using Forward Difference approximation is studied.
